

SMART FASHION RECOMMENDER APPLICATION

IDEATION:

We all are really tired of searching for the products they need. One of the main and most difficult things is to choose that best product. In this digital era, with the help of Artificial Intelligence, we can recommend the users to see and the best products which suits them. This can be done using the users' cookies and data.

What we will do:

We will develop a chat bot which recommends the best products for the user and helps in processing the payment and initiating the order delivery.

The chat bot also works as an advanced filter search to give accurate results that suits the user the best product.

There will be two modules: user and admin. The users can interact with the chat bot, search for products, order them, make payment track the delivery.

The admin interface enables the user to upload products, supervise the stock availability and interact with the buyer regarding the product as reviews.
